

Robustness of the OIS advantage over UPSIT

Intervals are 1,000 paired bootstrap resamples. The discovery-cohort interval includes zero (P = 0.092), and the centre split is reported as heterogeneity, not as support. The temporal split retrains the model on participants enrolled before 2017 and evaluates in hyposmia-group participants enrolled from 2017 (C 0.702 to 0.827).
